

CRF WorkManager

For Case Report Form Work Process Automation

In the growing era of global clinical trials and electronic data exchange, paper-based trials and the challenges they present are still prevalent. CRF WorkManager tackles those challenges, using technology to create results proven by years of successful experience.

Is your global workforce disconnected by distance? Have your paper documents gone missing en route? Have bottlenecks formed in your work processes because you can't follow the work? Has database lock ever been delayed?

With a combination of resource management, data capture and imaging technology, database integration, and FDA submission support tools, CRF WorkManager confronts these problems, reducing the burden of distance and time.

Resource Management with Automated Workflow

By creating automated workflows that mirror your business processes, you gain central visibility over your resources and your documents. You can see exactly when bottlenecks occur and resolve them instantly by moving the work to other resources. You can also set notifications to automatically trigger at specific steps, alerting you of work progress and events.

Rapid Data Capture

Rapid data capture minimizes manual data entry by employing optical recognition technologies to extract and process data from faxed or scanned CRF images. Our Remote Scan module enables offline scanning in further support of more efficient global trials.

Optical Recognition

With optical recognition technology, the same data entry staff can process up to 3 times more data in a specified time. The accuracy and efficiency of optical character recognition (OCR), intelligent character recognition (ICR) and mark-sense for extracting forms data means cleaner data and great time-savings.

Database Integration

CRF WorkManager offers tight, yet flexible integration with Oracle Clinical or Phase Forward Clintrial, delivering seamless access to your data, documents and business processes through one solution. The integrations feature discrepancy management, split-screen data entry, data upload and share study set-up and tracking.

In addition to database integration, we also provide the ability to integrate the entire clinical trial process. Data can be integrated across clinical systems and "pushed" to a decision-maker via portal technology.

CRF Submission Tools

These two modules simplify preparation and compliance with FDA e-submission guidelines.

Export Module prepares trial data for CRF Publisher by creating an index of specified criteria and linking selected annotations or comments to the CRF and DCF images.

CRF Publisher (by DTG Software) then converts those images, with their attached data, and performs "on-the-fly" PDF generation, complete with bookmarking, hyperlinking and table of contents generation.
